

Introduction to Robotics

CSE 461

Riad Ahmed

Lecturer, Dept. of Computer Science and Engineering

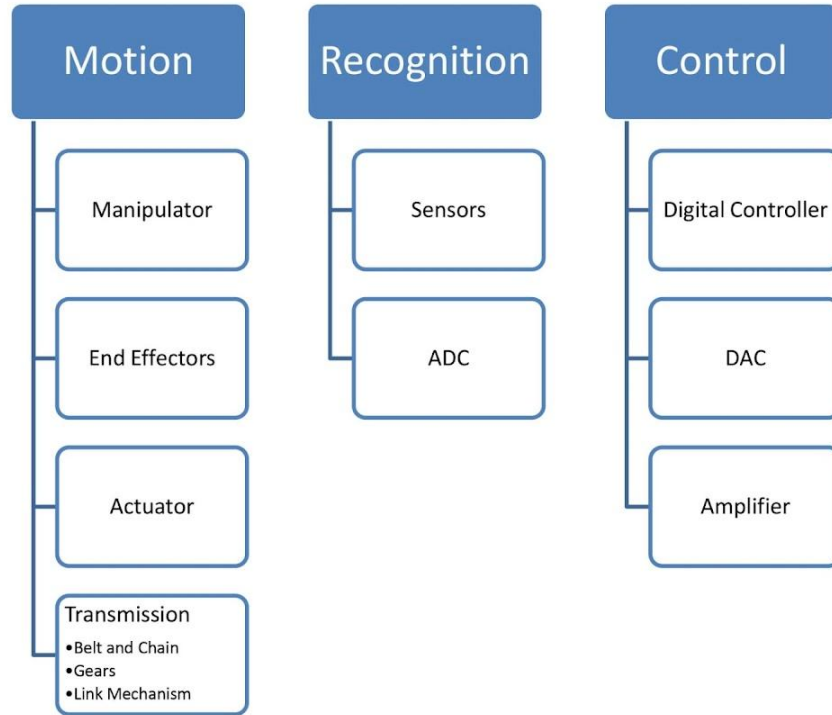

Brac University

Lecture 4: Chapter 1(Introduction to robotics: basics)

Previous Class

1. Paradigms

Subsystems

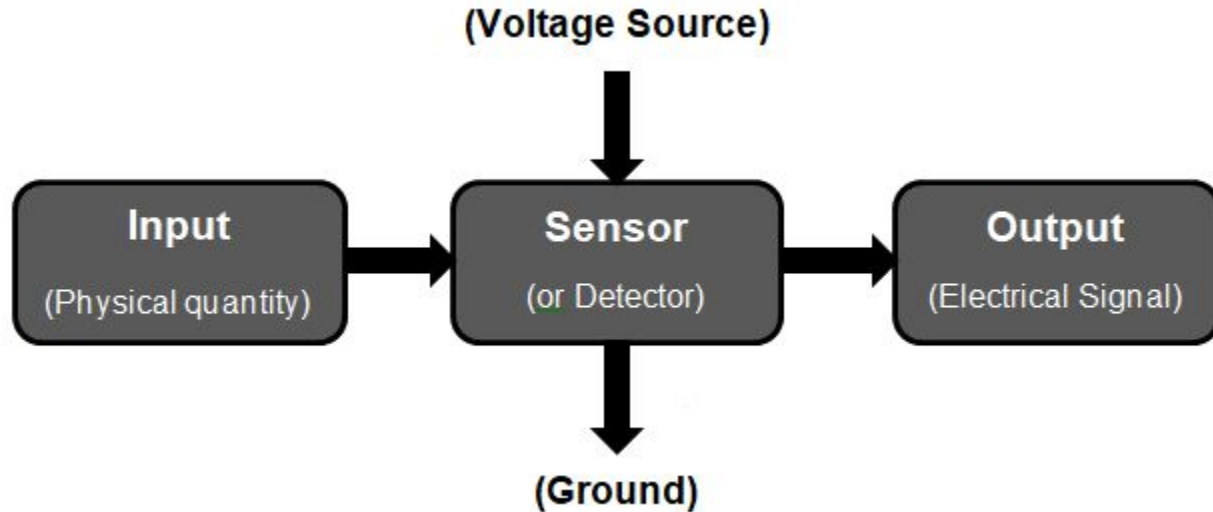

Subsystems

Sensor

A sensor is a device that detects or measures physical, chemical, or biological properties of the environment or a system and converts them into a signal that can be processed or analyzed.

Sensor Examples

Recognition

Physical Property

Sensor

contact

switch

distance

ultrasound, radar, infrared

light level

photocells, cameras

sound level

microphone

rotation

encoders and potentiometers

acceleration

accelerometers gyroscopes

More Sensor Examples

Recognition

Physical Property

Sensor

magnetism

compass

smell

chemical

temperature

thermal, infra red

inclination

inclinometers, gyroscopes

pressure

pressure gauges

altitude

altimeters

strain

strain gauges

Active sensors

Passive sensors

Ultrasonic Sensor

Converts electrical energy into acoustic wave, which is an ultrasonic wave travelling at above 18kHz frequency.

- HC-SR04 operates at 40kHz

a microcontroller is used for communication with an ultrasonic sensor.

Applications

- Measure wind speed and direction
- Navigation of UAV
- Measure tank depth

HC-SR04 Ultrasonic Sensor

(Source: Digikey)

Ultrasonic sensor measuring height during drone's flight.

(Source: RadioLink)

Ultrasonic Sensor: How It Works??

1. a microcontroller is used for communication with an ultrasonic sensor.
2. To begin measuring the distance, the microcontroller sends a trigger signal to the ultrasonic sensor. The duty cycle of this trigger signal is $10\mu\text{S}$ for the HC-SR04 ultrasonic sensor.
3. When triggered, the ultrasonic sensor generates eight acoustic (ultrasonic) wave bursts and initiates a time counter.
4. As soon as the reflected (echo) signal is received, the timer stops. The output of the ultrasonic sensor is a high pulse with the same duration as the time difference between transmitted ultrasonic bursts and the received echo signal.

Infrared Sensors

- An electronic device that can detect and measure infrared (IR) radiation in the environment
- Anything that emits heat (everything that has a temperature above around five degrees Kelvin) gives off infrared radiation
- Applications
 - TV Remote
 - Motion Sensing
 - Proximity Sensing

Infrared Sensors: How Active Sensing Works

Lidar

- Laser generates an optical pulse(*Up to 200,000+ pulses/second*)
- After reflecting off an object, the pulse returns to the receiver sensor
- High-speed counter measures the time of flight from the start pulse to the return pulse
- Time measurement is converted to a distance
- An onboard computer records each laser's reflection point, translating this rapidly updating "point cloud" into an animated 3D representation of its surroundings.

Subsystems

Manipulator

End-effector

End Effector

(a)

(b)

Two types of fingered end-effectors: (a) gripper type, (b) anthropomorphic type

Transmission (Belt and chain)

(a) Synchronous belt

(b) Roller chain

Transmission (Gears)

Spur gears

Helical gears

Straight bevel

Spiral bevel

Worm

Rack and pinion

Actuators

Pneumatic Actuator

Hydraulic Actuator

Electric Actuator

Pneumatic

Hydraulic

Electric

Characteristics	Pneumatic	Hydraulic	Electric
Efficiency	Low	Low	High
Reliability	Excellent	Good	Good
Maintenance	High user-maintenance	High user-maintenance	Little to no maintenance
Purchase Cost	Low	High	High
Operating Cost	Moderate	High	Low

Motor

Stator

Rotor

DC motor
